The lower values for chlorine, bromine and iodine are for organic compounds, the higher values are those which they possess in the salts. Kanonnikoff1 has also determined a few atomic refractions. His results, which do not differ much from those of Gladstone, are given on the next page. 1 J. f. pr. Oh. (2), 31, p. 339. The periodicity of the atomic refractions is unmistakable, the maxima falling on the elements of the fifth series, except in the case of arsenic. It is difficult to localise the minimum elements. They hover between groups seven, eight, one and two. Obviously, when we get better data, we shall arrive at more uniform results. The Spectra of the Elements. The study of spectra is of the utmost importance to the physical chemist, for it teaches more about the nature of the atoms than any other...
