From a given set of collocation point locations for each filament the local tangent, normal, and binormal vectors at each collocation point arech determined. These vectors are derived from helical arcs passed through ea set of three points. As mentioned, the desired solution is reached when the total velocity vector is tangent to the wake curve at every bnaecollocationlf-s), ehetye point. This total velocity vector at any point includes the local esVEthTt induction effect (SIVE), the contributions from the rest of the wake (BCand. ana the velocity induced by the bound circulation on the rotor blades, stempl swirl velocity componentassociated with the rotating coordinate osywcity local normal and binormal vectors can be used to define a lcrossflo each collocation point, as shown in Figure 3. If the total ve ta point has a component in...
